## COMP9334 Capacity Planning of Computer Systems and Networks

Week 1A: Revision problems

## Question 1

- An important part of performance analysis is to model the workload. In this question, you will look at a very simple model and we will generalise it to a very well known model in performance analysis in the lecture in Week 2.
- Consider a user who may send HTTP requests to a web server. In the time interval  $[k \ \delta, (k+1) \ \delta)$  where k is a nonnegative integer, there is a probability of p that this user will send an HTTP request to a web server and there is a probability of (1-p) that this user will not send. Assuming that the probability the user sends (or not send) in each time interval is independent. Assuming that the current time is  $10 \ \delta$ , what is the probability that this user will not send an HTTP request to the web server before  $30 \ \delta$ ?

## Question 2

- This is a revision question on probability distribution which you should be able to solve if you have the pre-requisites.
- Consider a continuous probability distribution with sample space is [1,∞) and probability density function
  - $f(x) = a / x^3 \text{ for } x \ge 1$
- What is the value of a in order that f(x) be a valid probability density function?
- What is the probability the probability that a number drawn from this distribution is exactly 10?
- Given this probability density function, what is the probability that a number drawn from this distribution has a value greater than 10?
